manufacturing

RadioPro provides best-in-class VoIP for two-way digital radios to allow communication from anywhere on conventional or trunked systems. RadioPro combines the flexibility to solve any Radio-over-IP challenge, ease of wide-area system deployment, and cost savings over other solutions. Enhance radio system functionality with the following RadioPro software applications for Windows™ PCs and notebooks and smart mobile devices.

RadioPro Dispatch is a multi-channel Windows™ desktop console, with optional modules for GPS tracking, voice dispatch, text messaging, and more!

RadioPro Talk is a low-cost alternative to tone-remotes, giving its users the functionality of a virtual radio on a Windows™ desktop, while focusing on simplicity.

RadioPro Mobile, is available for iOS and Android devices, enabling mobile users communication with two-way radios using simple push-to-talk.

Maximizing productivity on the plant floor starts with reliable communication. Linking operations between a central office, production facilities and all the areas in between is essential for operational efficiency. Affordable and easy to use, RadioPro software enhances that vital link for efficient connectivity for small and large manufacturing crews.

Whether a radio user is at a central office, or traveling between plants, RadioPro Dispatch provides administrative teams easy access to the plant floor and field personnel. Features such as superb audio quality, intuitive interface, selected and un-selected audio, missed-call tracking, instant playback, man-down emergency call, and patching improve immediate communication for increased productivity and emergency preparedness.

In addition, when used with digital two-way radios, the integrated GPS module allows administrators to track the location of vehicles, such as delivery trucks. The Dispatcher module will display a radio user's position on a map as well as a status indicator to show whether a vehicle is stopped or moving and its location. Easily determine if unauthorized breaks or detours from the delivery schedule have been made by drives.

CTI Products' RadioPro software includes the RadioPro Mobile application for iPhone and Android. This application allows users to reliably communicate with two-way radio systems from anywhere, twenty-four hours a day, seven days a week. Response time never been more immediate.

Since all voice calls, text messages, and GPS data is logged to the database, reports and safety incident review are available. Administration teams can easily search, filter and review events recorded on a particular scene. Voice calls of interest may be merged together for a seamless replay of an incident. Reports are also available to show how long a driver stops at a location, a driver's speed during travel, a user's radio voice call usage, and other important productivity data.

Key Features For Manufacturing

- Multi-Chanel Voice Dispatch
- iOS & Android Mobile App
- GPS/AVL Tracking
- Data Reports
- Archive Search & Filter
- Custom Action Buttons configured to call specialized emergency response teams

CTI Products is pleased to announce the merger of two of its software applications. TurboVUi and RadioPro were introduced to provide digital two-way radio users with a means to enhance their digital radio communication. TurboVUi will soon be incorporated into RadioPro to strengthen our product offerings. RadioPro will offer all of the features and benefits TurboVUi users have come to expect, including the same high quality service.
